

4 Subway

4hp / 22mm deep / 5ma - 460ma on +12v

Hop in, hop out, change line, cross the platform to get in a new carriage. This is Subway 4, a utility collection cleverly normalized letting you choose the path you need for your signal, at any time.

Have fun!

Rectify

An active full wave rectifier that takes any negative voltages and inverts them so they become positive. This effectively doubles the frequency of bipolar waveforms. It's cleverly normalized to line 1.

Power

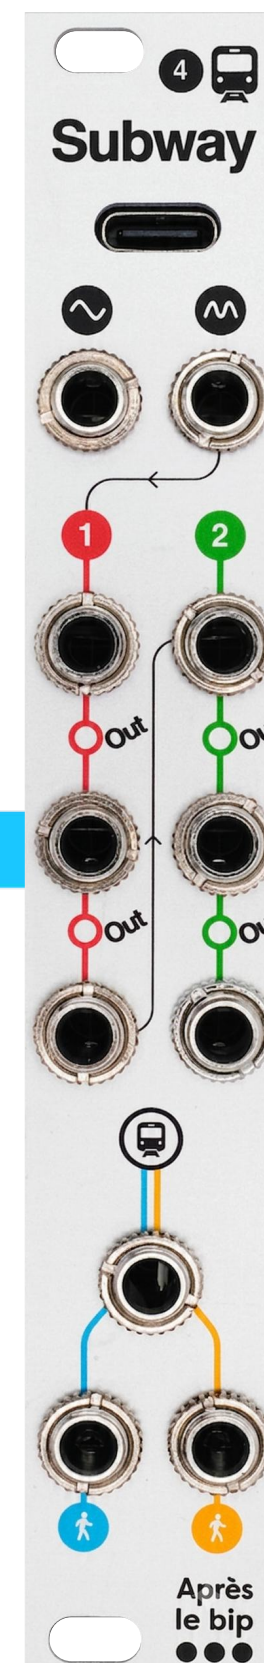

A usbc socket that will give you 5v power for your external devices such as phones or lamps, up to 900mA.

Mix

2:1 unity mixer. It takes audio and control voltage. It will average the 2 signals.

Multiply

Two lines of 1 to 2, or one line of 1 to 4 multiplies by normalization. Line one takes the full wave rectifier if nothing is patched.

What is a full wave rectifier ?
